

WHAT IS CLAIMED IS:

- 5 1. A method for locating an element of interest contained in a three-dimensional object comprising the steps of:
- a. providing a set of digitized stereotaxic images having positions of homologous regions of interest corresponding to the element of interest and appearing in the set of stereotaxic images;
 - b. selecting in a first stereotaxic image a first target region of interest having a target pixel;
 - c. matching the first region of interest with a second region of interest homologous to the first region of interest and appearing in a second region of interest;
 - d. matching a generated target window of chosen dimensional characteristics and containing the target region of interest around the selected target pixels;
 - 15 e. determining a set pixels in the second image according to a predetermined selection criterion so as to generate a second window having the same dimensional characteristics as the target window around each selected pixel;
 - f. processing a correlation between the gray-scale levels of the pixels in each second window to obtain a correlation for each second window; and
 - 20 g. using the correlation values to identify the region of interest homologous to the target region of interest and thereby minimize the risk of matching error between the homologous regions of interest.

2. The method of claim 1 wherein the correlation values includes the selection of a certain number of correlation maxima or minima, the homologous region of interest being selected from those for which the associated correlation value is one of the correlation maxima or minima.

3. The method of claim 2, wherein the analysis of the correlation values obtained includes a determination of the dynamic range of the maxima or minima selected, and the comparison of the dynamic values obtained with a threshold.

4. The method of claim 1, wherein the correlation processing includes a normalized correlation processing.

5. The method of claim 1 wherein the correlation processing includes a normalized difference processing.

6. The method of claim 1 wherein the matching includes a prior filtering of the stereotaxic images.

7. A method for locating an element of interest contained in a three-dimensional object comprising the steps of:

a. providing a set of digitized stereotaxic images having positions of homologous regions of interest corresponding to the element of interest and appearing in the set of stereotaxic images;

b. selecting in a first stereotaxic image a first target region of interest having a target pixel;

c. matching the first region of interest with a second region of interest homologous to the first region of interest and appearing in a second region of interest;

d. matching a generated target window of chosen dimensional characteristics and containing the target region of interest around the selected target pixels;

5 e. determining and storing a first set of numerical values, respectively representing predetermined characteristics of any region of interest for the target region of interest on the basis of the gray-scale values of the pixels in the target window;

10 f. determining in the second image a set of pixels belonging respectively to candidate regions of interest appearing in the second image according to predetermined selection criterion;

g. generating a second window, containing the corresponding candidate region of interest around each of the selected pixels;

15 h. determining and storing a second set of numerical values, respectively representing the predetermined characteristics for each candidate region of interest, on the basis of the gray-scale values of the pixels in the associated second window; and

20 i. identifying the region of interest homologous to the target region of interest on the basis of a comparison processing between the first set of numerical values and each second set of numerical values so as to minimize the risk of matching error between the homologous regions of interest.

8. The method of claim 7, wherein the predetermined characteristics comprise shape, contrast or gradient characteristics.

0914301410

9. The method of claim 7 wherein the comparison processing includes a distance minimization processing between the two sets of numerical values.

5 10. The method of claim 8 wherein the comparison processing includes a distance minimization processing between the two sets of numerical values.

10 11. The method of claim 1 wherein an epipolar zone containing at least the epipolar segment relating to the target pixel is determined in the second stereotaxic image and the pixels in the epipolar zone contain the selected pixels.

12. The method of claim 7 wherein an epipolar zone containing at least the epipolar segment relating to the target pixel is determined in the second stereotaxic image and the pixels in the epipolar zone contain the selected pixels.

15 13. The method of claim 1, wherein the selected pixels are chosen from the pixels in the second image which have a gray-scale level maxima or minima whose dynamic range is greater than a predetermined threshold.

20 14. The method of claim 7, wherein the selected pixels are chosen from the pixels in the second image which have a gray-scale level maxima or minima whose dynamic range is greater than a predetermined threshold.

15. The method according to claim 7, wherein the matching includes a prior filtering of the stereotaxic images.

16. A method for locating an element of interest contained in a three-dimensional object comprising the steps of:

a. providing a set of digitized stereotaxic images having positions of homologous regions of interest corresponding to the element of interest and appearing in the set of stereotaxic images;

b. selecting in a first stereotaxic image of a first target region of interest;

c. selecting in a second stereotaxic image on the basis of a first automatic matching of at least one second region of interest which may be homologous to the target region;

d. determining the spatial position of a candidate pixel of a candidate element of interest corresponding to the two regions of interest;

e. determining in a third stereotaxic image of a projected pixel corresponding to the projection into the third stereotaxic image of the candidate pixel;

f. providing a second automatic matching between the target region of interest and a vicinity of the projected pixel; and

g. defining a projected region of interest so as to minimize the risk of matching errors between the homologous regions of interest.

17. The method of claim of claim 16 wherein the selecting in the second stereotaxic image is on the basis of the first automatic matching a set of second regions which may be homologous to the target region;

determining the spatial position of each candidate pixel corresponding to each pair of regions of interest which is formed by the target region and one of the second regions;

determining the spatial position in the third image of each corresponding projected pixel; and
